Back End Administrator View

1. **Dashboard Overview**
   - Key metrics: Active users, recent transactions, performance statistics and error logs.
   - Recent activity: Recent admin activities – logins, data changes and user interactions.
   - System Health: Highlight any issues with system health, such as server status or API response times.

2. **User Management**
   - User accounts: View, edit, suspend or delete user accounts.
   - User roles and permissions: Manage roles (admin, moderator, user) and assign permissions to each role.
   - Authentication records: View login history, failed login attempts, and session data for security.

3. **Data and Database Management**
   - Data Overview: View statistics and summaries for all main data types (e.g., users, transactions, closed accounts).
   - Data Import/Export: Download data as CSV, Excel, or other formats for reporting and backup.
   - Data Backup: Access options for database backup and restoration.

4. **Reports and Analytics**
   - Usage Statistics: Analyze user activity, engagement metrics, user demographics, time spent answering the screening and completing the intervention, time paused during intervention and screening results.
   - Sales/Transaction Reports: If applicable, view sales reports, revenue, and transaction histories.
   - System Performance Analytics: Track page load times, server requests, and other performance data.

5. **Notifications and Alerts**
   - Error Alerts: Notify the admin of errors, exceptions, or critical failures.
   - User Alerts: Show user feedback, flagged content, or requests for assistance.
   - System Updates: Alert the admin when software updates, patches, or upgrades are available

6. **Audit Logs and Security**
   - Action Logs: Track administrative actions (e.g., changes made by specific admins, login attempts).
   - Access Logs: Monitor login times, IP addresses, and any unusual access attempts.
   - Data Integrity: Set up alerts for unusual data changes, like mass deletions or edits.
